# The new supplementary indicators to unemployment rate; an alternative analysis of the labour market 

Riccardo Gatto e Niki Stylianidou

20 June, 2013

#### Abstract

The scope of this article is to give a new interpretation of the labour force market in terms of wellbeing. For this reason the newly introduced from Eurostat labour statuses are associated with two concepts of wellbeing: the first on the Integration within the Working Word and the second the job-leisure time equilibrium within the potential labour force framework The combination of the two concepts can be used as a kind of proxy of wellbeing. The two theories are presented using the longitudinal data of the italian Labour Force (from 2004 until 2010 for the age class 15-74). Besides the presentation of the above theories also some structural characteristics (analysis by gender, education and average age) of the Italian LF market structure are presented.

## 1 Theory

Dealing with the inner dynamics and mobility of the Italian labour force market, the traditional way for demonstrating the inertia among the labour statuses is by means of the transition matrix. In a previous article the transition matrix of the Italian labour force longitudinal data from the year 2004 up to 2010 and using the new definitions as introduced by Eurostat on November 2011 have been presented .

Constructing the New Approach
Here it will be presented how the new labour status classifications can be re-considered as a proxy indicators of wellbeing within the labour force framework. This kind of analysis is possible only with the new classifications Labour Force as proposed by Eurostat on Novembre 2011. The ILO traditional labour states (employed, unemployed and inactive) are still the main official reference indicators of the European indicators of the labour market. However as the labour market complexities increase, it increase the need for a better comprehension and thus to affine the labour market statuses. For this reason the Eurostat following the ILO indications (18th ICLS) decided to step ahead and refine the employed and inactive statuses using the principium of the attachment to the Labour Force. Thus the new Labour Force status became six and defined as following: ${ }^{1}$

Employed In the context of the Labour force survey (LFS), an employed person is a person aged 15 and over (or 16 and over in Iceland and Norway) who during the reference week performed work - even if just for one hour a week - for pay, profit or family gain. Alternatively, the person was not at work, but had a job or business from which he or she was temporarily absent due to illness, holiday, industrial dispute or education and training. This definition follows guidelines of the International Labour Organization (ILO).

Other employed worker the above definition is the original one found in the Eurostat glossary. Regarding the other employed workers satisfy the above definition but they are also work full time equivalent or for less time but they do not wish working more time.

Under employed part time worker An underemployed part-time worker is a person aged 15-74 working part-time who would like to work additional hours and is available to do so. Part-time work is recorded as self-reported by individuals. This statistical indicator covers persons who, in spite of being employed, do not work full-time and lack a sufficient volume of work, which is somewhat similar to being unemployed. The part-time requirement in the definition is important because the people who work full-time and still want to work more hours have a different profile: in spite of working many hours they have insufficient income; underemployed part-time, on the other hand, highlights situations of insufficient volume of work and underutilized labour among persons already employed.

[^0]Unemployed An unemployed person is defined by Eurostat, according to the guidelines of the International Labour Organization, as:

- someone aged 15 to 74 (in Italy, Spain, the United Kingdom, Iceland, Norway: 16 to 74 years);
- without work during the reference week;
- available to start work within the next two weeks (or has already found a job to start within the next three months);
- actively having sought employment at some time during the last four weeks.

The unemployment rate is the number of people unemployed as a percentage of the labour force.

Jobseekers alias Persons seeking work but not immediately available are the sum of persons aged 15-74 neither employed nor unemployed who:

- are actively seeking work during the last 4 weeks but not available for work in the next 2 weeks;
- found a job to start in less than three months and are not available for work in the next 2 weeks;
- found a job to start in three months or more;
- are passively seeking work during the last 4 weeks and are available for work in the next 2 weeks.

Passive job search is e.g. waiting the results of a job interview. The first of those 4 groups is the biggest by far. The three latter groups are included in this indicator for completeness as they are not ILO unemployed but have many common characteristics with people in the first group. This indicator describes jobless people who do not qualify for recording as unemployed because of their limited availability to start a new job.

Want to work alias Person available to work but not seeking $=$ Persons available to work but not seeking are persons aged 15-74 neither employed nor unemployed who want to work, are available for work in the next 2 weeks but do not seek work. This indicator covers jobless people who do not qualify for recording as unemployed because they are not actively looking for a job. It includes, among others, discouraged jobseekers and persons prevented from job seeking due to personal or family circumstances. The sum of the two groups persons seeking work but not immediately available and persons available to work
but not seeking is called the potential additional labour force (PAF). Persons in the PAF are not part of the standard labour force, which is the sum of employed and unemployment persons. However persons in the PAF have a stronger attachment to the labour market than other economically inactive persons.

Inactive Hard are all the persons over 15 years old that do not want or seek to be employed.

Eurostat created the definitions for Under-employed part time, Jobseekers and Want to work", identifying them as "Unemployment halos", having as a reference the two root principles of Labour Force framework. The first principle refers for identifying the economically active persons from the non economically active while the second principal refers for defining, within the economically active persons, the employed from the unemployed.
The first principle ${ }^{2}$ : the Activity Principle : "determined on the basis of what the person was actually doing during the specified reference period (activity principle). The purpose of the Activity Principle is to make measurement of the labour force as objective as possible."

The second principle is the "Attachment to Labour Market": ${ }^{3}$ A person has a kind of attachment at the labour market if satisfies one of the following three criteria:

- Being employed
- Looking actively for a work
- Available within 2 weeks to start working

The persons of 15-74 that do not satisfy any of this criteria are considered having no attachment to the labour market. In this article is propose the consideration that Inactive Hard are happy to stay in this status as it is a choice not to look for a work. note : put the link

In this paper using the above two principles and the new Eurostat definitions, of six item labour statuses it can be considered that: (a) the "Other employed" labour status: the persons belonging in this status are completely happy regarding their job-leisure wellbeing. Moreover it can be claimed that they feel satisfied regarding their integration in the working word. (b) the "Inactive Hard" labour status: the people belonging this status are not economically active and they do not satisfy non of the two principles. However it can be assumed that are happy regarding their non-integration into the working word and their job-leisure well-being is in a satisfying for them level. ??

[^1]Using the above considerations it can be concluded that in terms of work integration (second principe) and in terms of job-leisure wellbeing all the six labour status categories can be ranked having on as Top ranked (fully integrated in the working word and jobleisure wellbeing happy) the "Other employed" and as a Last Raked the"Inactive Hard" (out of the working word but happily job-leisure wellbeing).
Second ranked is the "Under employed part-time" as they are part of the working word but they work less hours than the full time and the hours the aim to work. Thus the integration with the working word is satisfied (they have a job) but the job-leisure wellbeing is not so much satisfying.
Third ranked are the people belonging to the "Unemployed" labour status. They are not fully integrated to the labour word and their job-leisure wellbeing is not so much satisfying as they seek for working and thus according to the "attachment at the labour market" are strongly attached to the labour word.
The fourth ranked labour status is the "Jobseekers" as the persons belonging in this group are actively looking for a work (thus the first principle is satisfied and one of the three items of the second principle is satisfied) however the fact that are not immediately available (within 2 weeks) to take over a job buts them completely out of the working word.
The fifth ranked labour status is the "Want to work" and are all the persons that are immediately available to take over a job however they they did not look for a job in the last four weeks before the interview. Thus the first principle is not satisfied and from the second principle is only satisfied one of the three items. Thus the "Want to work" are the last group indicating also people with the looser attachment to the woking word.

Full integrated in the Labour World $\Longleftarrow$ Other Employed $\Longrightarrow$ optimal Job-Leisure time distribution
Not fully integrated in the Labour World $\Longleftarrow$ Part Time Underemployed $\Longrightarrow$ nonoptimal Job-Leisure time distribution
Not integrated in the Labour World $\Longleftarrow$ Unemployed $\Longrightarrow$ non-optimal Job-Leisure time distribution
Not integrated in the Labour World $\Longleftarrow$ Jobseekers $\Longrightarrow$ non-optimal Job-Leisure time distribution
Not integrated / Out of the in the Labour World $\Longleftarrow$ Want to work $\Longrightarrow$ non-optimal Job-Leisure time distribution
Out of the Labour World $\Longleftarrow$ Inactive Hard $\Longrightarrow$ optimal Job-Leisure time distribution
Two possible dynamic behavior of the six labour statuses may be the following: a "long term" behavior: considering the "Other Employed" and the "inactive Hard" as the two poles of attraction, the first one as the fully attached and integrated in the labour market world and the second pole as the one of the zero attachment and not at all integrated, nor interested to be part of the labour force, then the intermediate labour statuses maybe attracted to the nearest of the two poles. The forces that push the intermediate
labour status towards the two poles is the search of felicity and the need of satisfying the job-leisure personal equilibrium. Of-course the above argument holds under the rationality hypothesis. In this case the elasticity coefficient of each labour status, will not be very high.

A "short term" behavior: each of the six labour status suffers from inertia (has small coefficient of elasticity of transition) from one period to another one. (see in appendix the graphics regarding the transition matrix)

On a previous paper the transition matrixes were presented of the persons 15-74 and it is clearly shown that the demonstration is easy to do with the help of graphs. In the annexes the graphs are presented regarding the transition matrixes

Some structural characteristics of the six labour profiles: gender, average age and education level. but before starting speaking about the labour status profiles throught the tables found in the appendix some facts must be appointed:

- The six years total average aged 15-74 years old are 21 million 413 thousand men and 22 million 55 thousand women, for a total of 43 million 468 thousands.
- The average age of the population reference in the six years is around 44 years old
- The "representative" person of the population universe has low education level mainly corresponding to : Licenza media (33\%). The second biggest group (around 30\%) has the Diploma Superiore which corresponds to a medium education level. As a smaller group ( $15 \%$ ) has the Elementary diploma which is again a low education level. (footnote da scrivere la corrispondeza da 12 items x SG24 a edu che 3 items)

Coming to the profiles ${ }^{4}$ :
"other employed" $={ }^{5}$ the gender seems to be a strong component on both dimensions integrated in the working word and Job-Leisure time distribution as there are more registered men that women in this category: the probability to belong in the "other employed" after a year nevertheless the initial labour status you where at the benign of the year is on average $60,7 \%$ if you are a $\operatorname{man}^{6}$ but only $37,7 \%{ }^{7}$. if you are a woman. Moreover the probability being in the a labour status as "other employed" and to remain after one year in the same status is $93,8 \%$ for men while for women is $90,7 \%$. The average transition probability of un "unemployed" to become "other employed" is $34 \%$ if your are a man and $27 \%$ if you are woman. In more detail average number of men registered in the six observed years, is approximate 12 million, 172 thousands, found after a year to belong in the same category of other. The average age of the other employed profile is 41 years old. The most

[^2]common education level of the "other employed" is low (on average $60 \%$ of the population) while the around $70 \%$ of the high education level belong in the "other employed"-"other employed" cell.

Under- employed part-time:
In the next section are represented the analysis done by three different models. The first model separates the two labour world into two status: satisfied and unsatisfied regarding both dimensions; the necessity to be part of a group integration within the labour force and the second dimension the Job Leisure time distribution.

The formulation of the first model is: final labour force status=intercept $+\mathrm{b} 1 *$ initial labour force status $+\mathrm{b} 2^{*}$
